- What
 - Geographical area
 - Questions addressed
- Why
- How
 - Weather data: APIs and {weatherOz}
 - RMarkdown scripts
 - Render commands & YAML variables
 - Interactive shiny
- Examples

What: Geographical area

https://www.agriculture.gov.au/sites/default/files/images/CLUM_map_December2023_agricultural_industries_v2.png

What: Questions addressed

- Growing season rainfall
 - Total (mm)
 - Relative to historical data (decile)
 - Historical median (mm)
 - Anomaly (mm, %, relative to median mm)
- Extreme weather
 - Heat stress
 - Frost
 - Erosion strength wind
- Break of season
- Potential yield
- Green bridge risk
- Thermal time

Why?

- Date ranges
 - Bespoke date ranges - not 'monthly' or 'three monthly'
 - Requirements driven by current season
- Reference years
- At any time – not just at the end of the month
- Quick turn around - 'next day'
- Derived measurements - soil water, potential yield

How: Weather Data

- Queries to APIs
- RMarkdown scripts
- R package: `weatherOz` available from <https://github.com/ropensci/weatherOz>

How: Weather Data - the APIs

- DPIRD - Weather
 - DPIRD stations
 - Minute data; 15 minute - annual summaries
 - Many variables
 - Calculated variables: Extreme weather event endpoints
- DPIRD - Science
 - DPIRD and BOM stations
 - Daily summaries
 - Rain, min temp, max temp (limitation of our queries)
- SILO
 - selected BOM stations
 - Daily or monthly summaries
 - Many variables

How: RMarkdown scripts

- Developed incrementally, in consultation
- Create map(s) and a dated log
- Common skeleton / structure
 - Parse input variables
 - Query API for current list of stations
 - Acquire and tidy weather data
 - API
 - Saved file
 - Save data
 - Report on data
 - Make maps - iterate over variables

How: Render commands

The user's one bit of code

```
rmarkdown::render(  
  file.path(  
    "configuration",  
    "scripts",  
    "map_raintodate.Rmd"  
  ),  
  output_file = paste0(  
    format(Sys.time(), "%Y-%m-%d-%H-%M"),  
    "_rain_to_date.html"  
  ),  
  output_dir = file.path("output","logs"),  
  envir = new.env(),  
  params = "ask")
```

How: Interactive shiny

The User's time to shine

Start Date (default: growing season start)

Rainfall to:

Reference period start year

Reference period end year

Save results to

Input file - leave blank to source data directly from the weather API

Which data set do you want mapped?

- Rainfall to date
- Median rainfall and anomaly maps
- Decile maps

How: YAML

```
---  
title: "Rainfall to date"  
author: "SSF-Run"  
date: "`r format(Sys.time(), '%e %B %Y at %H:%M')`"  
output:  
  html_document  
params:  
[...]  
---
```

```
start.date:  
  label: "Start Date (default: growing season start)"  
  input: date  
  value: !r as.Date(format(Sys.Date(), "%Y-04-1"))  
clim.year.1:  
  label: "Reference period start year"  
  input: numeric  
  value: 1975  
set.type:  
  label: "Which data set do you want mapped?"  
  input: select  
  choices: [AWS, PPD, ALL]  
  value: "ALL"
```

rtd:

label: "Rainfall to date"

input: checkbox

value: TRUE

outdir:

label: "Save results to"

input: text

value: !r file.path("output", "maps", "rainfall")

file:

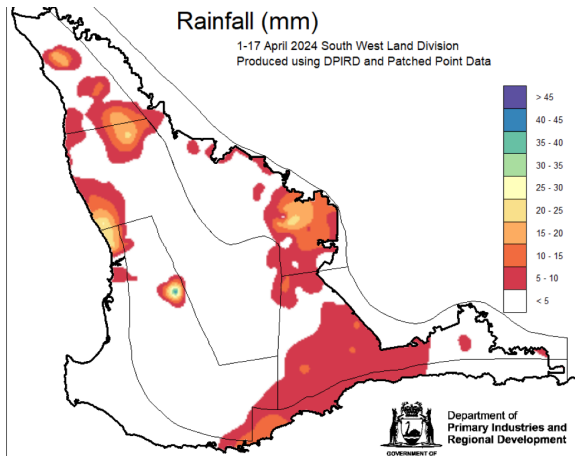

label: "Input file"

value: NULL

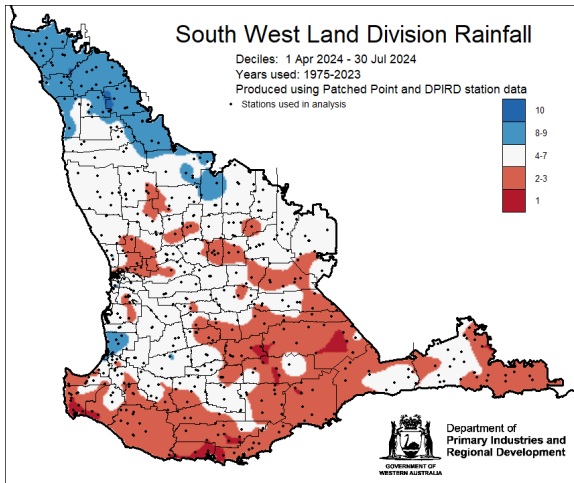

input: select

choices: !r ssf.adjacent::find.files(file.path("../", "

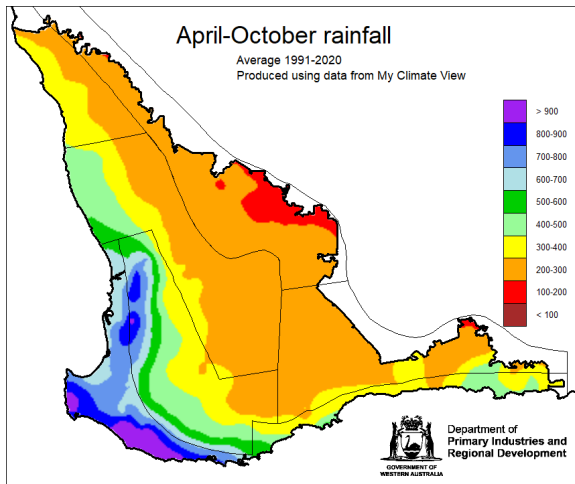

Current Rainfall

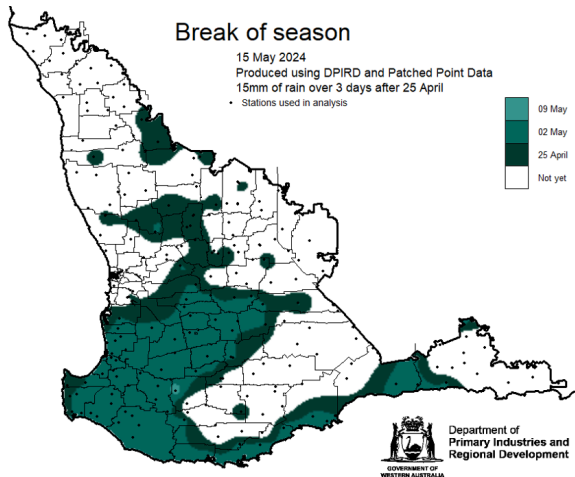

Rainfall Deciles

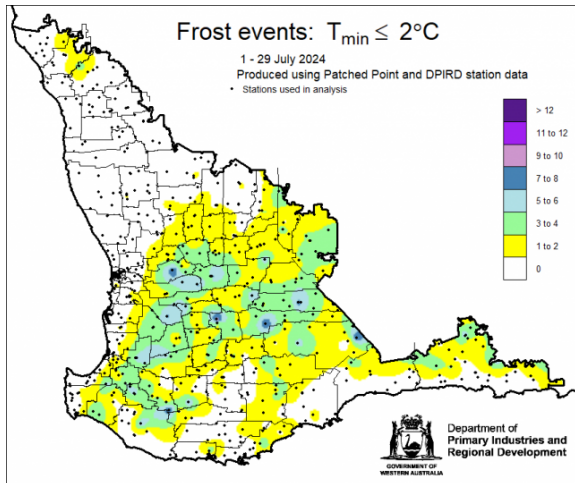

Variations - CVT & Ag zones

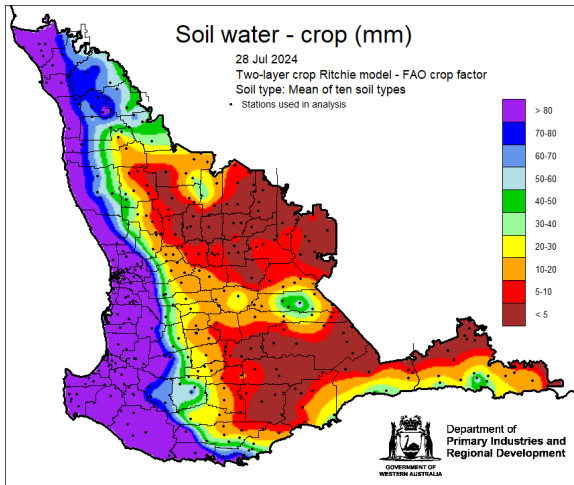

Break of Season

Frost Potential

Plant Available Soil Water

Summary

- More than pretty pictures
- Useful education tools
- Targeted information for growers
- Unique information
- Rapid turnaround
