

How many neutron stars are there in our Galaxy?

*Galaxy-wide inference based on a
small slice of censored data*

Accreting neutron stars

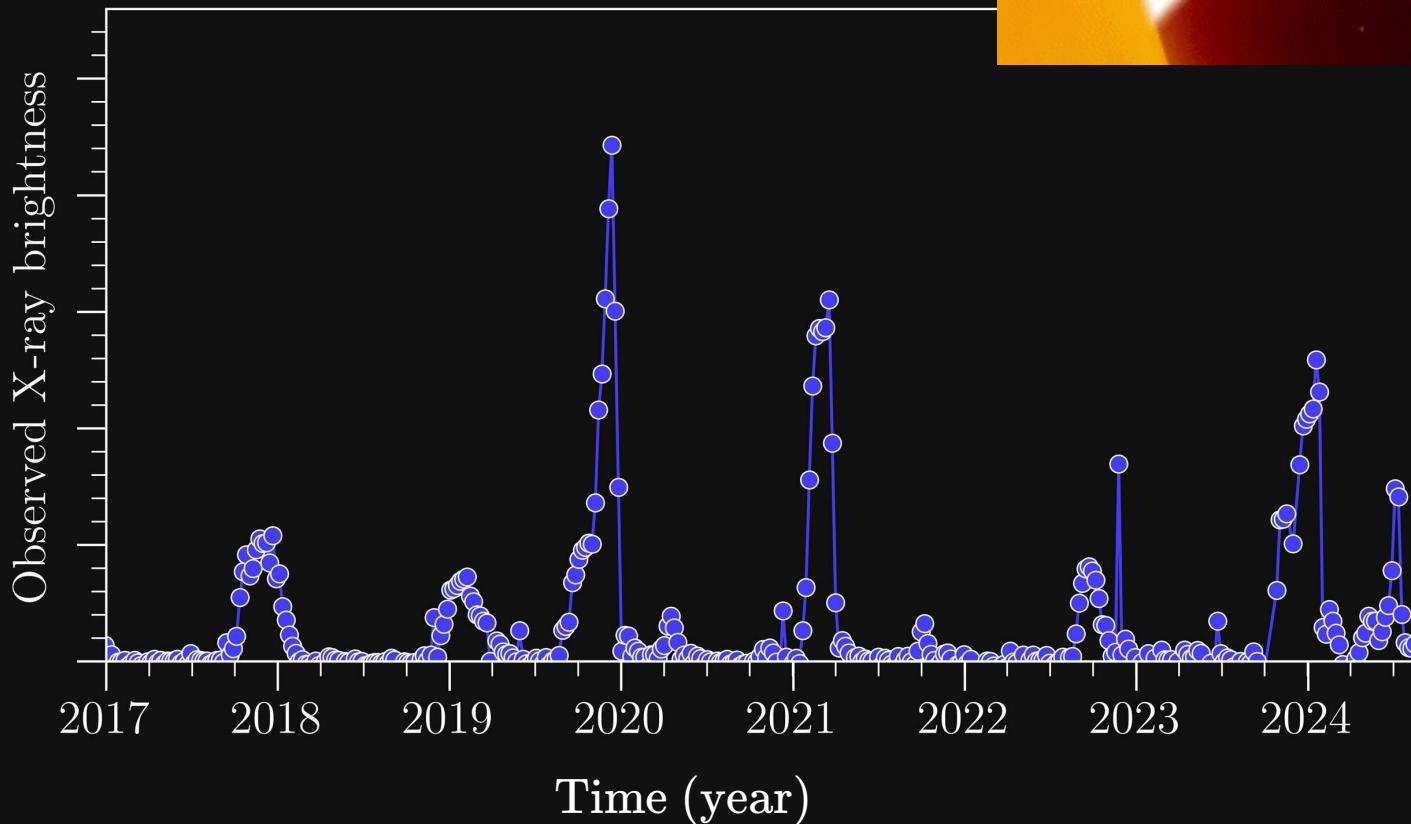

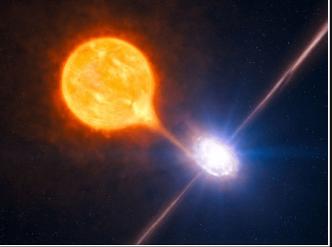

Accreting neutron stars

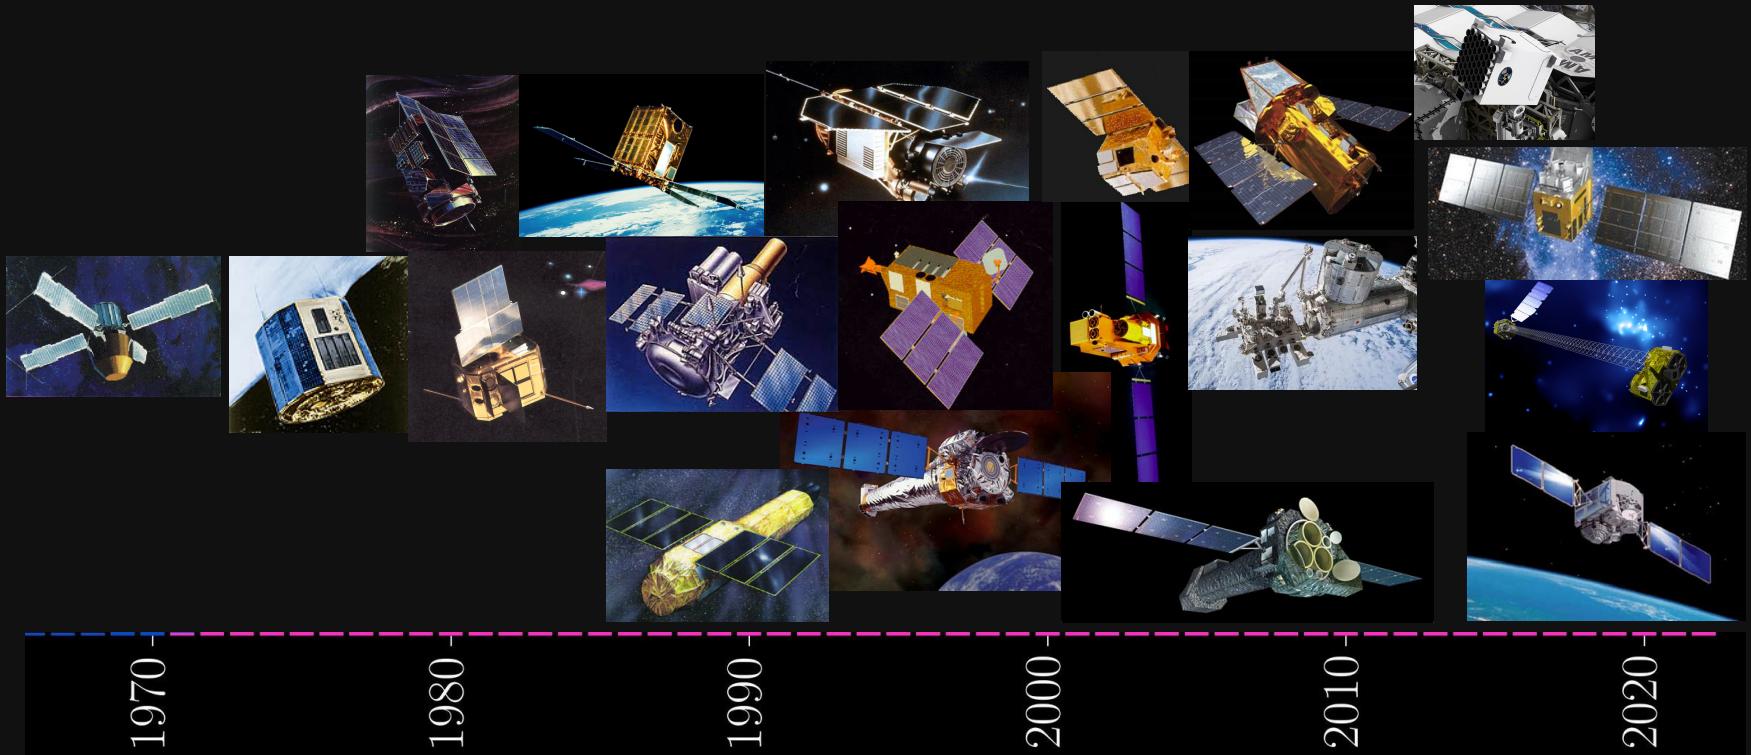

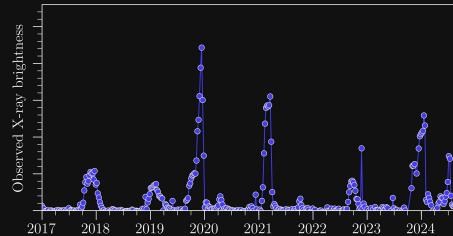

Accreting neutron stars

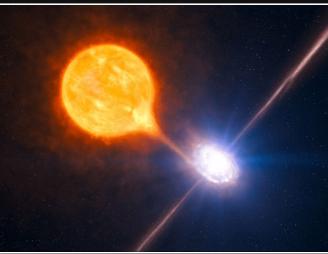

Accreting neutron stars

How we observe and detect them

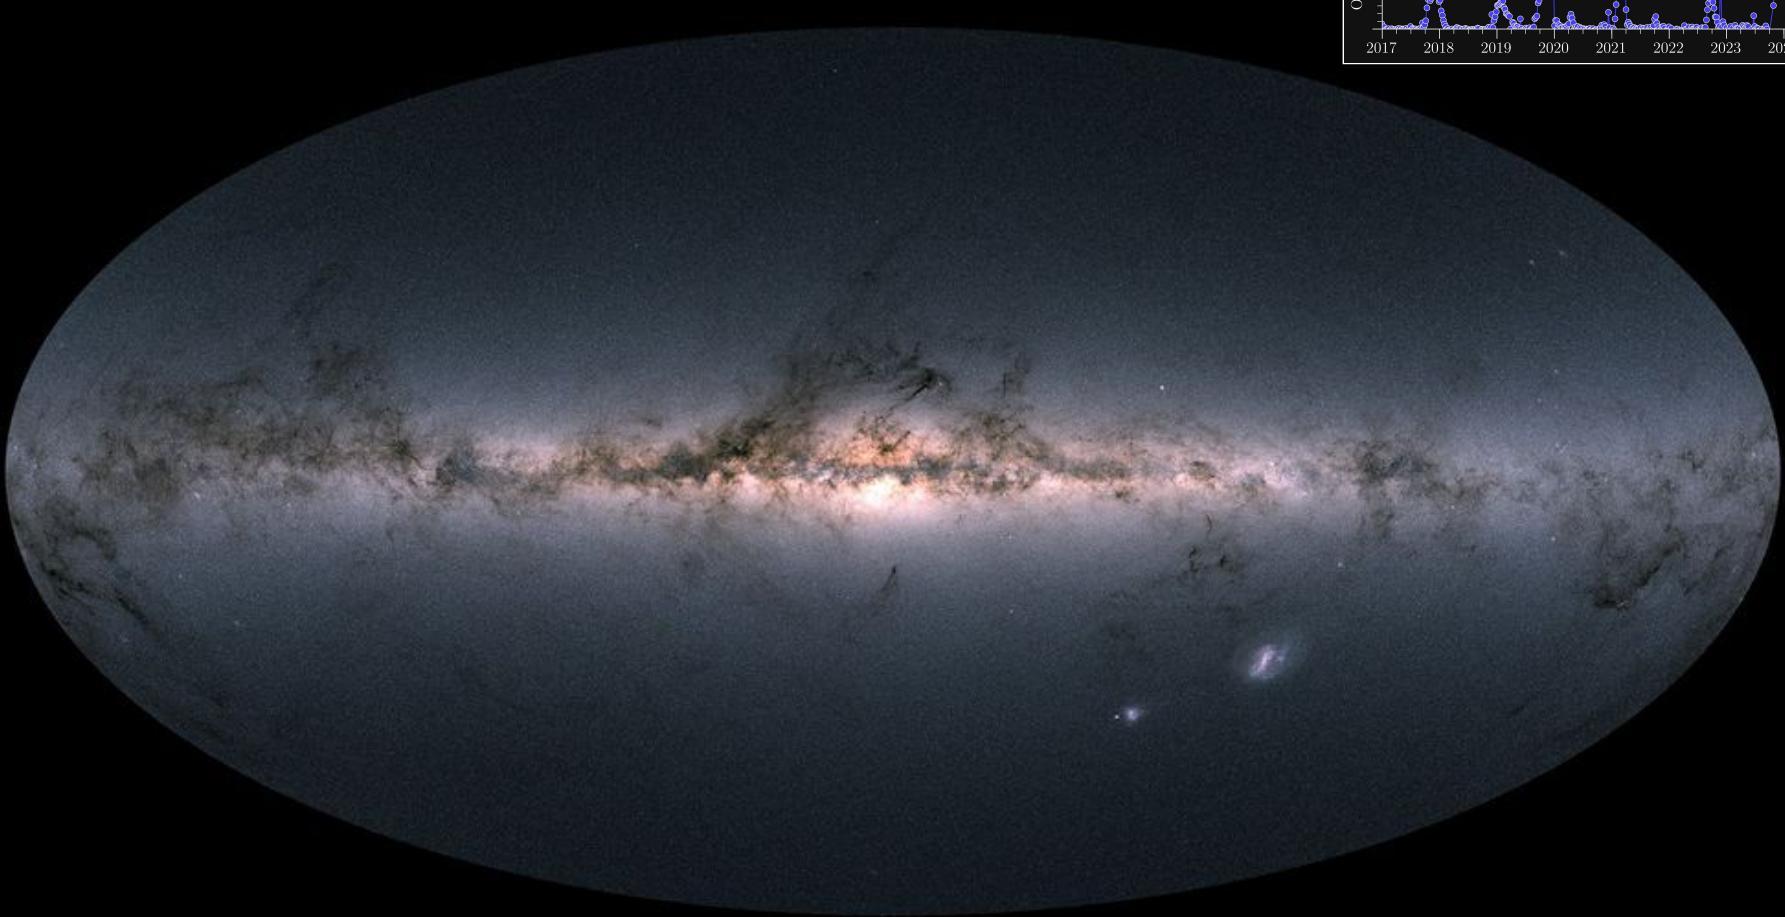

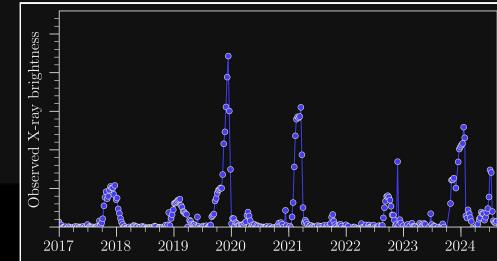

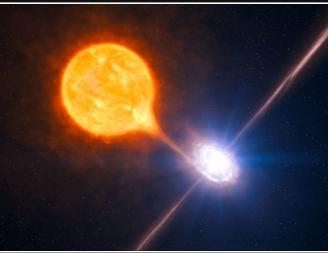

Everything is based on 50 years of observational data,
no controlled experiments

Accreting neutron stars

What fraction of accreting neutron stars
have we observed?

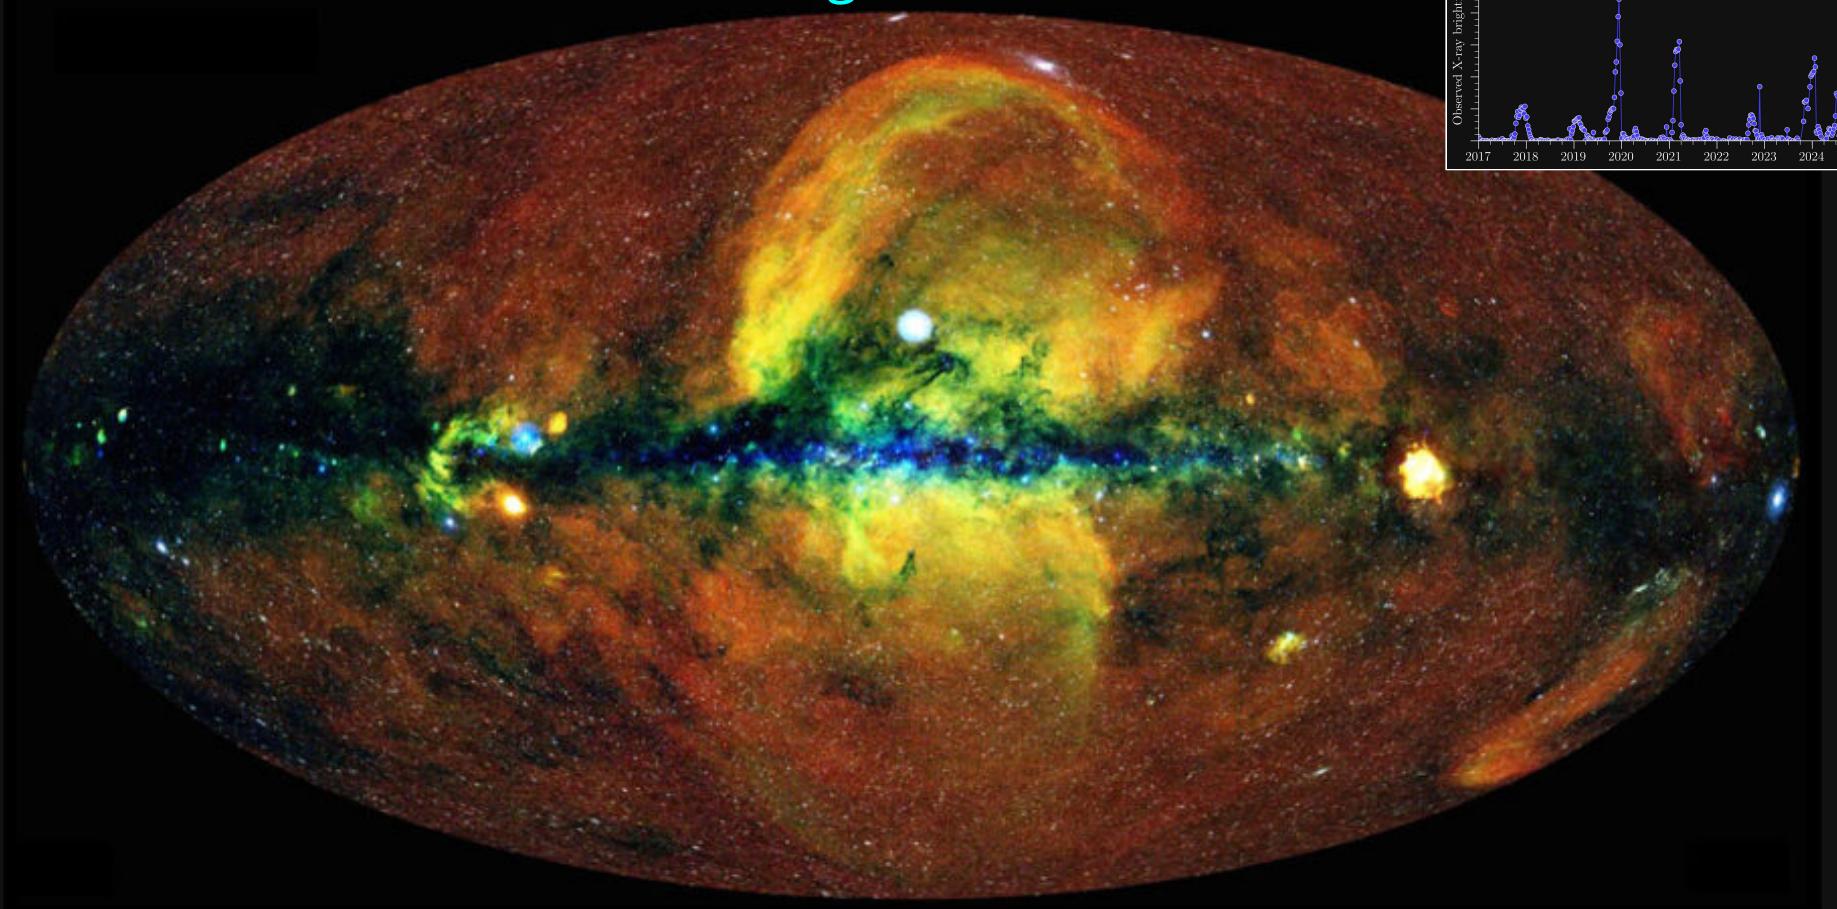

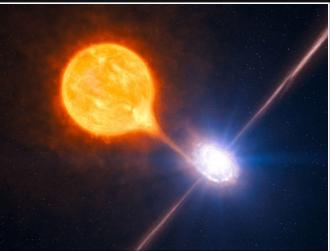

Accreting neutron stars

What fraction of accreting neutron stars have we observed?

*If we have stared at our Galaxy for long enough,
have we caught them all there?*

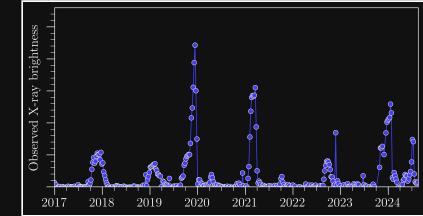

Accreting neutron stars

What fraction of accreting neutron stars have we observed?

*If we have stared at our Galaxy for long enough,
have we caught them all there?*

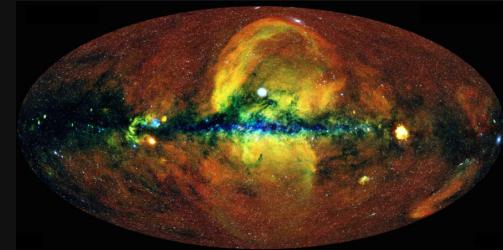

What we have:

- observed data;
a tiny slice of time from a long-span time-series

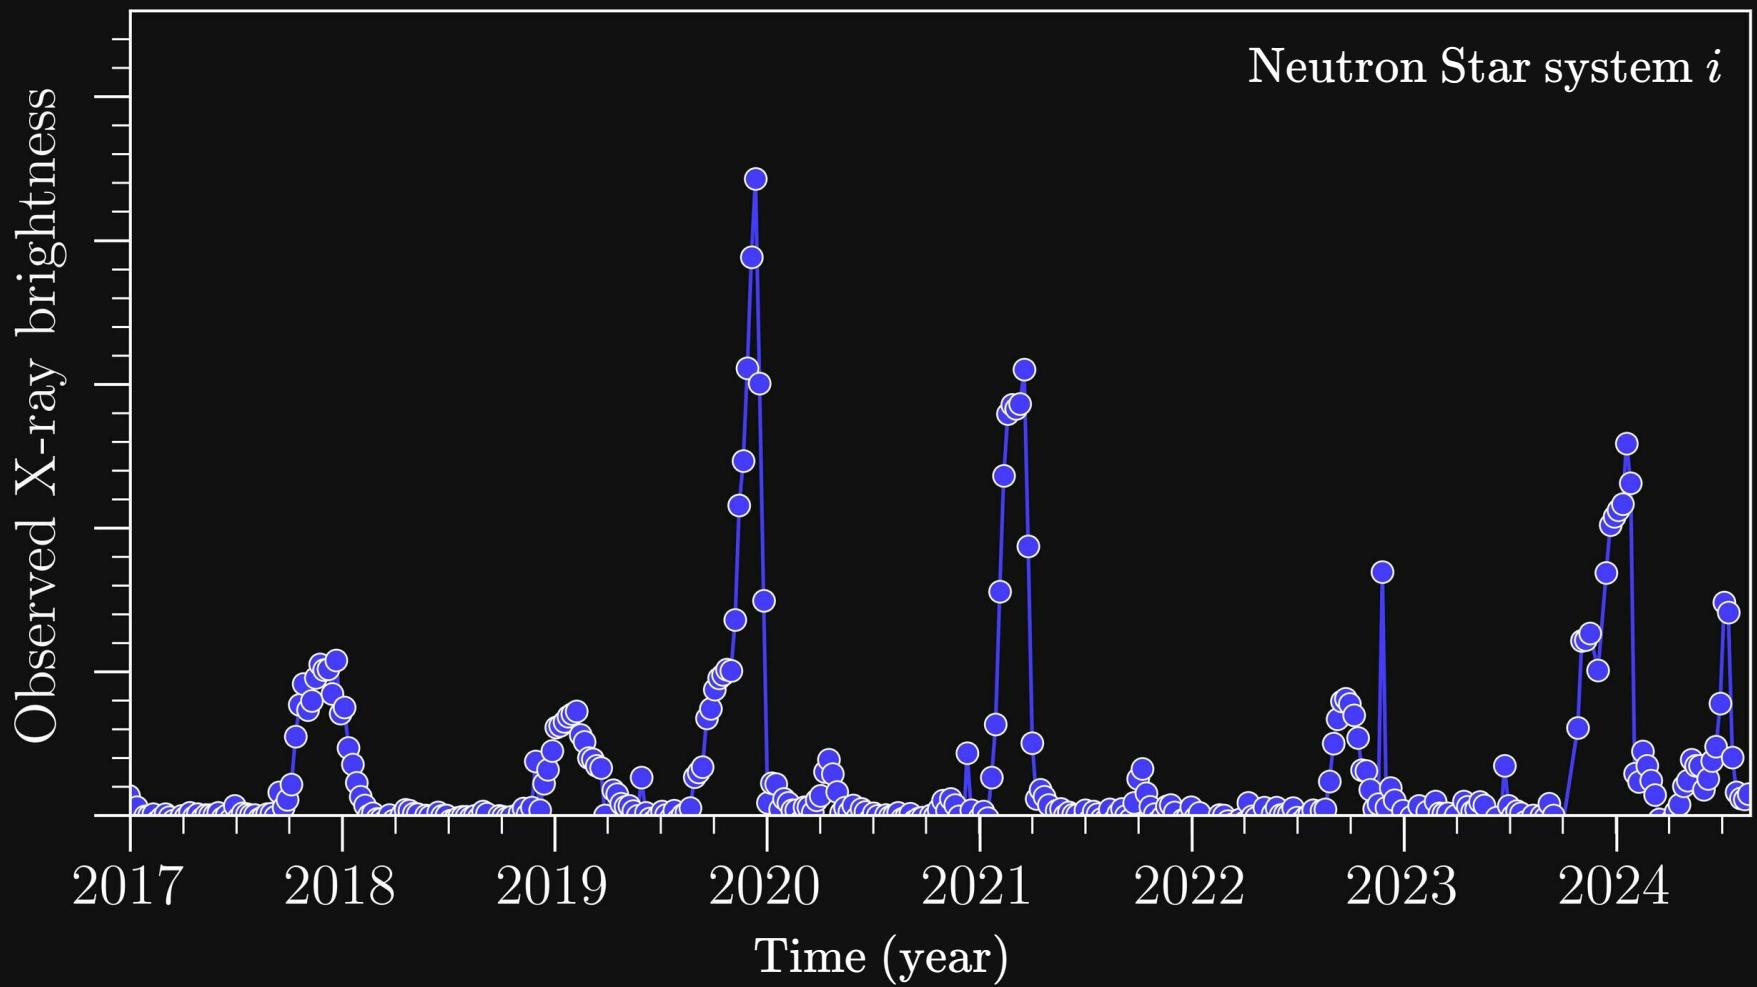

What we are aiming for:

- Building a statistical model to describe accreting neutron stars in our Galaxy

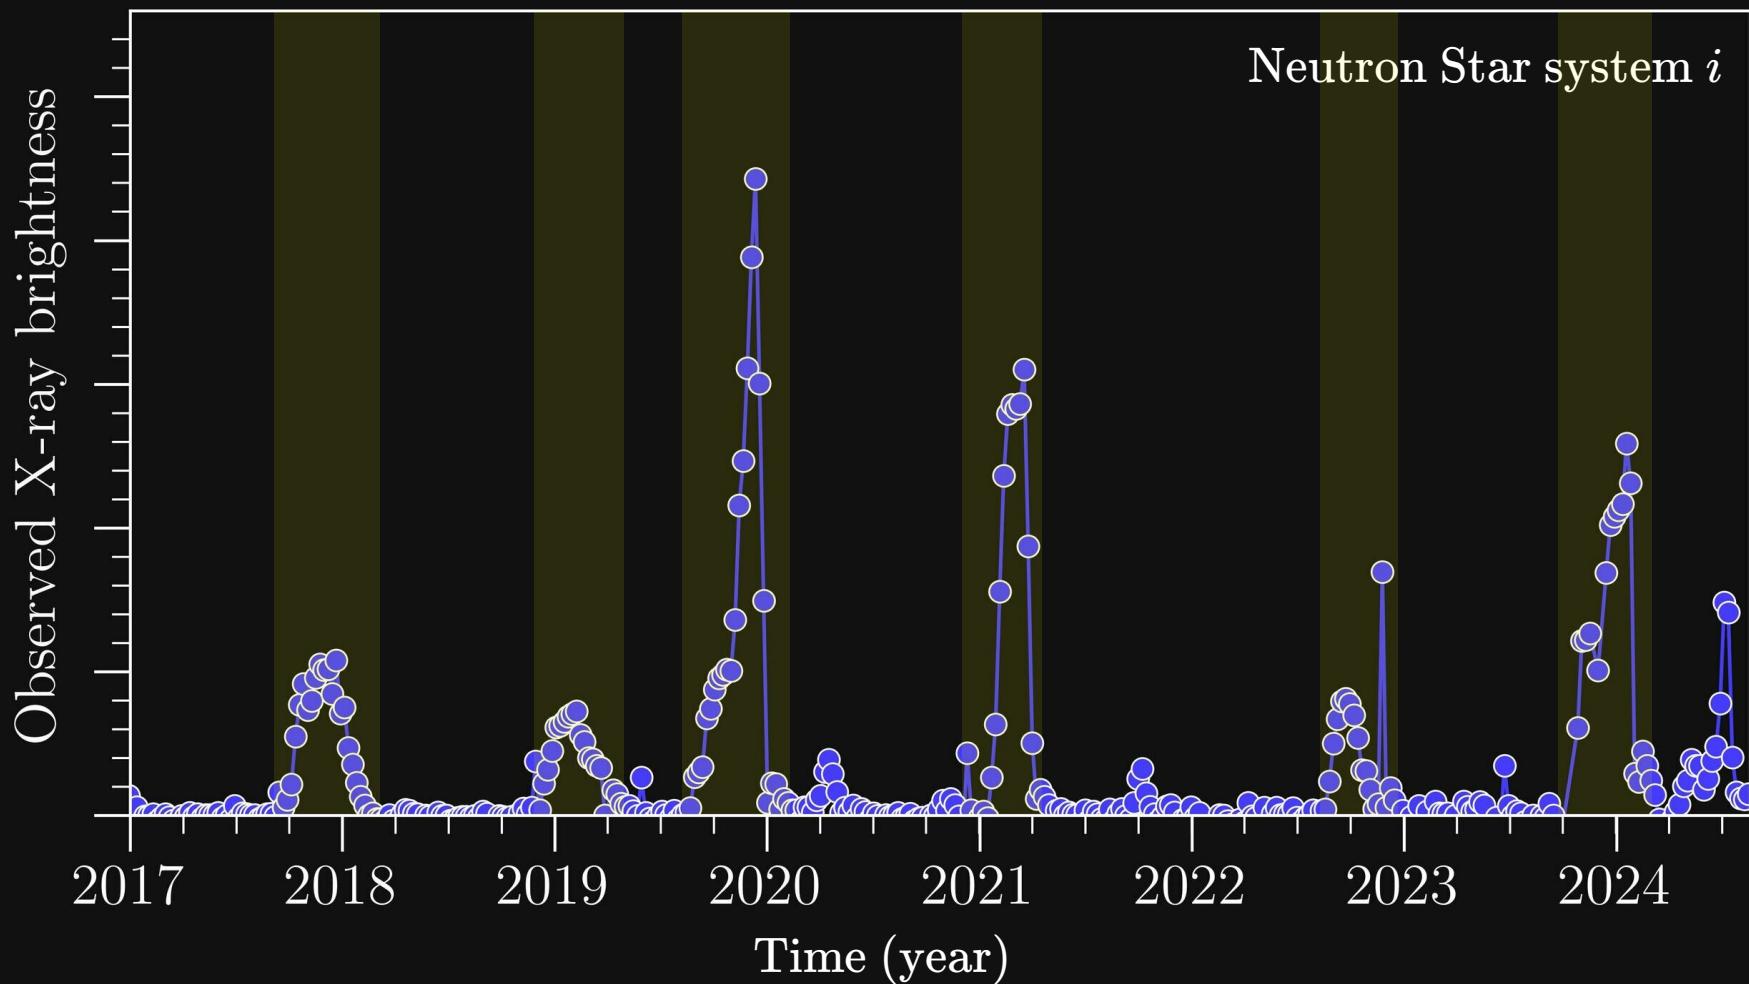

The data

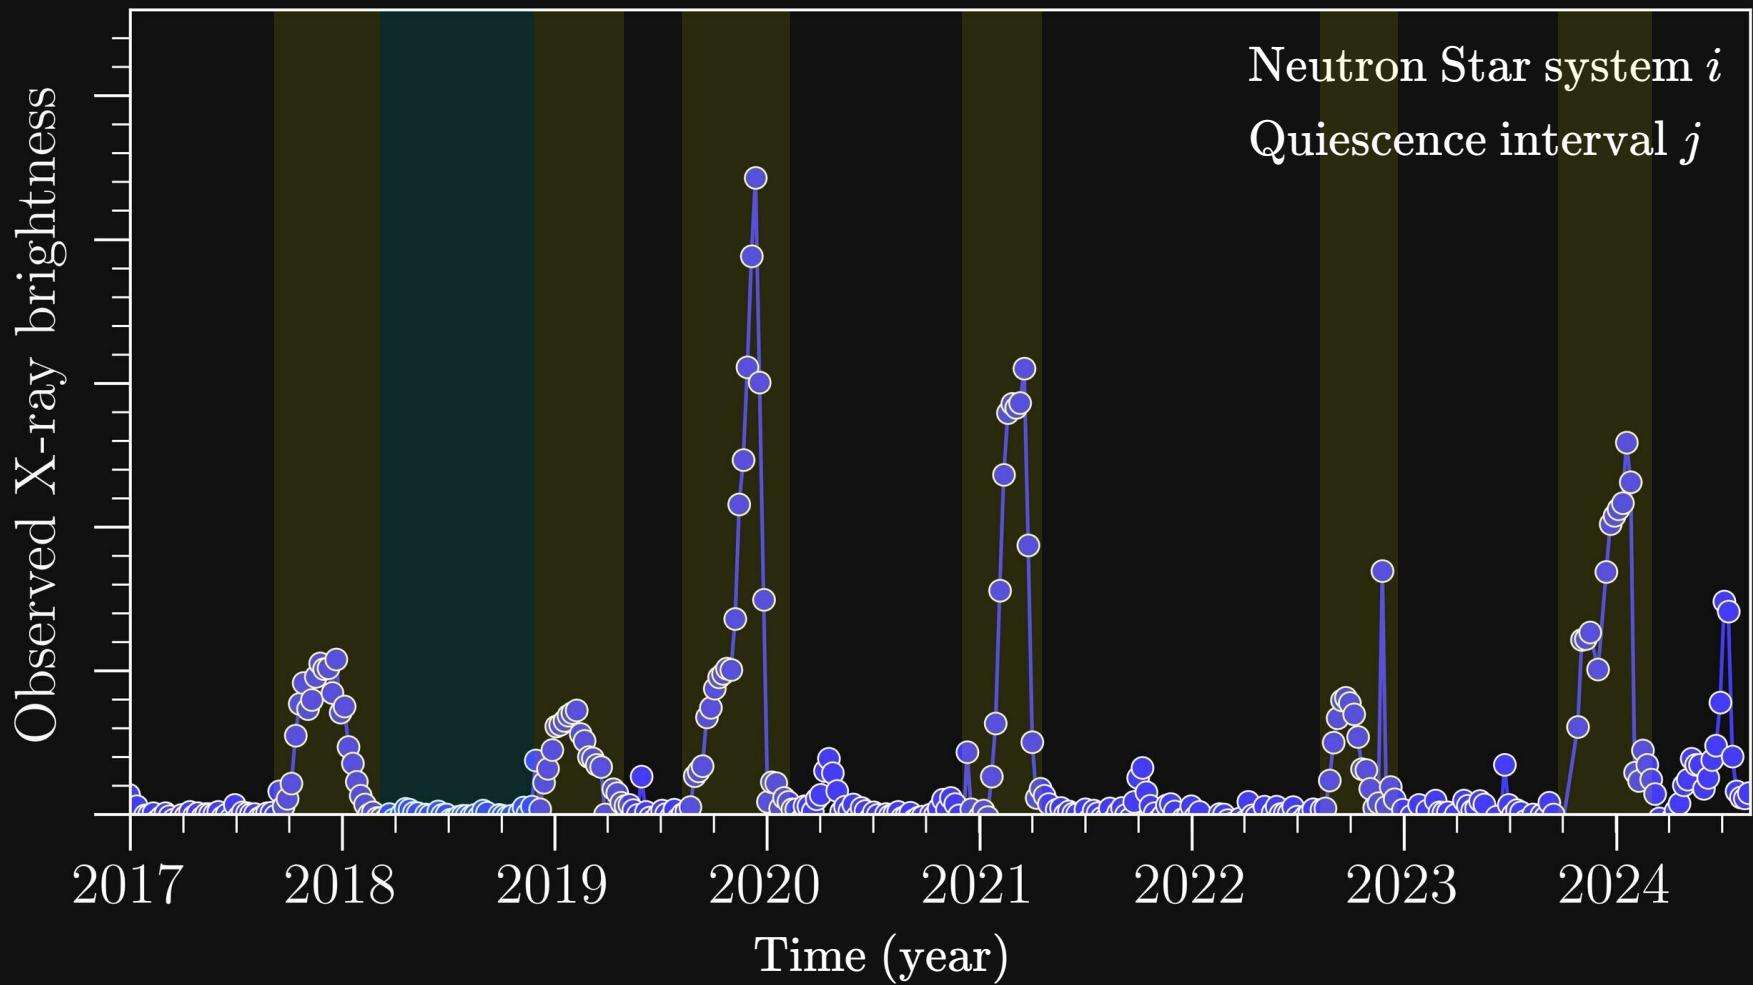

The data

Outburst j

Quiescence interval j ($\hat{\tau}_{i,j}$)

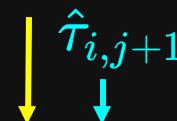

Outburst j

Quiescence interval j ($\hat{\tau}_{i,j}$)

$$\tau(P_{\text{orb}}, \dot{M})$$

Inferred

$$\bar{\tau}_i$$

Estimated

$$\hat{\tau}_{i,j}$$

Early results and future directions

*If we have stared at our Galaxy for long enough,
have we caught all accreting neutron stars there?*

Probably missing a significant fraction

Next steps

- Quantifying the fraction of missing systems
- Considering role of formation scenarios
(i.e., sensitivity to the priors)
